the author examines logic and methodology of design from the perspective of computer science computers provide the context for this examination both by discussion of the design process for hardware and software systems and by consideration of the role of computers in design in general the central question posed by the author is whether or not we can construct a theory of design

a new approach to theory development for practice driven research proposing that theory is something made in and through design tendencies toward academization of traditionally practice based fields have forced design to articulate itself as an academic discipline in theoretical terms in this book johan redström offers a new approach to theory development in design research one that is driven by practice experimentation and making redström does not theorize from the outside but explores the idea that just as design research engages in the making of many different kinds of things theory might well be one of those things it is making redström proposes that we consider theory not as stable and constant but as something unfolding something acted as much as articulated inherently fluid and transitional redström describes three ways in which theory in particular formulating basic definitions is made through design the use of combinations of fluid terms to articulate issues the definition of more complex concepts through practice and combining sets of definitions made through design into programs these are the building blocks for creating conceptual structures to support design design seems to thrive on the complexities arising from dichotomies form and function freedom and method art and science with his idea of transitional theory redström departs from the traditional academic imperative to pick a side theory or practice art or science doing so he opens up something like a design space for theory development within design research

foremost experts in their field have contributed articles resulting in a compilation of useful and timely surveys in this ever expanding field each of these 12 original papers covers important aspects of design theory including several in areas that have not previously been surveyed also contains surveys updating earlier ones where research is particularly active

this book examines the theoretical foundations of the processes of planning and design when people alone or in groups want to solve problems or improve their situation they make plans horst rittel studied this process of making plans and he developed theories including his notion of wicked problems that are used in many fields today from product design architecture and planning where rittel s work was originally developed to governmental agencies business schools and software design rittel s ideas are being used this book collects previously unavailable work of rittel s within the framework of a discussion of rittel s theories and philosophical influences

this book deals with the basic subjects of design theory it begins with balanced incomplete block designs various constructions of which are described in ample detail in particular finite projective and affine planes difference sets and hadamard matrices as tools to construct balanced incomplete block designs are included orthogonal latin squares are also treated in detail zhu s simpler proof of the falsity of euler s conjecture is included the construction of some classes of balanced incomplete block designs such as steiner triple systems and kirkman triple systems are also given t designs and partially balanced incomplete block designs together with association schemes as generalizations of balanced incomplete block designs are included some coding theory related to steiner triple systems are clearly explained the book is written in a lucid style and is algebraic in nature it can be used as a text or a reference book for graduate students and researchers in combinatorics and applied mathematics it is also suitable for self study

excerpt from design in theory and practice it is the aim of this book to be helpful not only to teachers and students who may be directly interested in the subject but to the many others who feel the lack of a criterion or standard to assist them in forming a judgment in questions of design though the book is written primarily for workers i have endeavored to tell the story in such way that it may be of interest to the general reader a judgment is of little value unless it can be backed with a logical reason if we would judge wisely and discriminate well it must be from a more stable basis than personal whim or fancy to fully appreciate a piece of constructive work it is necessary to put ones self as nearly as is possible in the place of the worker study the environment in which he worked the conditions that confronted him in a solution of his problem the technical limitations and possibilities through which his idea took definite form and from which his design derives character and style about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

the venerable cities of the past such as venice or amsterdam convey a feeling of wholeness an organic unity that surfaces in every detail large and small in restaurants shops public gardens even in balconies and ornaments but this sense of wholeness is lacking in modern urban design with architects absorbed in problems of individual structures and city planners preoccupied with local ordinances it is almost impossible to achieve in this groundbreaking volume the newest in a highly acclaimed series by the center for environmental structure architect and planner christopher alexander presents a new theory of urban design which attempts to recapture the process by which cities develop organically to discover the kinds of laws needed to create a growing whole in a city alexander proposes here a preliminary set of seven rules which embody the process at a practical level and which are consistent with the day to day demands of urban development he then puts these rules to the test setting out with a number of his graduate students to simulate the urban redesign of a high density part of san francisco initiating a project that encompassed some ninety different design problems including warehouses hotels fishing piers a music hall and a public square this extensive experiment is documented project by project with detailed discussion of how each project satisfied the seven rules accompanied by floorplans elevations street grids axonometric diagrams and photographs of the scaled down model which clearly illustrate the discussion a new theory of urban design provides an entirely new theoretical framework for the discussion of urban problems one that goes far to remedy the defects which cities have today
